

Figure 1. Plot of length (minus polar plugs) and width of Trichuris eggs from two samples (459.1 and 1220) from Isle of May excavations 1996. The points represent a total of 16 measured eggs; equivalent measurements for eggs from a coprolite from 6-8 Pavement, York (Jones 1983) were in the range 46-56 μm (data rounded to nearest whole micron) by 23-31 μm . The mean values for the Isle of May eggs were 48 by 24 μm .
