

Notes on the vertebrate remains from 16 Toft Green (site code 1999.255)

by Cluny Johnstone

Methods

Where possible, fragments were identified to species or species group, using the reference collection at the Environmental Archaeology Unit, University of York. Fragments not identifiable to species were grouped into categories: large mammal (assumed to be cattle, horse or large cervid) and medium-sized mammal (assumed to be caprovid, pig or small cervid). The total weight of bone was recorded for each context

Results

Context 1000

1 sheep radius (complete, fused and measurable)
Weight = 38.6 g

Context 1002

1 pig tibia (measurable)
1 cow 2nd phalanx
1 cow M1/M2
2 large mammal unidentified fragments
Weight = 65.8 g

Context 2003

1 cow radius (measurable)
3 medium-sized mammal unidentified fragments
8 large mammal unidentified fragments
Weight = 433.5 g

Context 2004

1 sheep / goat metatarsal
1 sheep / goat M3
4 large mammal unidentified fragments
Weight = 102.1 g

Context 2005

1 large mammal unidentified fragment
Weight = 11.3 g
