Note: Unfitness is measured against eleven factors (disrepair, dampness, structural stability, food preparation, heating, lighting, WC, Bath/shower/wash basin, ventilation, drainage, water supply).

Before 1989 unfitness was judged in terms of the condition of the property. Post-1989 a dwelling is defined as unfit if it fails to meet a satisfactory standard for any any individual factor.

The change in definition significantly increased the number of dwellings defined as unfit.
