Introduction

Individual participant data (IPD) reviews are typically non-Cochrane reviews published in a print journal on behalf of a collaborative group. Some are subsequently published on the Cochrane Database of Systematic Reviews (CDSR).

There is no guidance in the current version of the Cochrane Handbook on converting IPD reviews to Cochrane Reviews, which may create challenges for both IPD reviews authors and Cochrane Review Group (CRG) editorial teams.

Objectives

To assess how IPD Meta-analysis Methods Group members tend to publish their IPD reviews and their reasons for the publication route taken.

Methods

We developed a questionnaire to determine:

• Where IPD reviews were being published and why a particular publication route was chosen.
• Experiences of publishing IPD reviews in CDSR.

An online tool (SurveyMonkey™) was used to create a survey with answer choices presented in a randomised order each time to help minimise question choice bias.

The survey was circulated to all members of the Methods Group.

All responses were collated and analysed using SurveyMonkey™ analysis tools.

Results

Response rates and number of IPD reviews published

65 members of the Methods Group were surveyed

31 responses have been received to date (48% response rate)

• 6 respondents (9%) had never published an IPD review.
• 25 respondents (38%) had published at least one IPD review.

Publication route was known for 73 out of the 95 IPD reviews (77%)

→ No detailed information available for n=22 IPD reviews.

All 73 IPD reviews were published in a print journal first:

→ 49 were published in a print journal only
→ 24 were published in a print journal first and subsequently converted to a Cochrane Review
→ None of the reviews were co-published
→ None of the reviews were published on CDSR first

Converting IPD reviews to Cochrane Reviews

Reasons for converting IPD reviews to CDSR (11 respondents)

Respondents cited a variety of reasons for conversion with the main reason being the opportunity for wider dissemination of results.

Challenges and potential barriers to the conversion process (11 respondents)

Over half (55%) of respondents who converted their IPD reviews experienced a variety of challenges, mainly citing difficulties in converting their reviews to the Cochrane format.

The future for conversion of IPD reviews to Cochrane Reviews

What would encourage conversion of IPD reviews (25 respondents)

Respondents mainly cited clear policy and guidance as ways in which they would be encouraged to convert their IPD reviews to Cochrane Reviews in future.

Likelihood of converting IPD reviews to Cochrane Reviews in the future

11 respondents converted at least 1 IPD review; 14 respondents had not converted any reviews:

• 81% of those who had converted at least 1 IPD review thought it was likely or very likely that they would continue to ensure that it remains the best single source of reliable evidence about the effects of health care.

Conclusions

• If more IPD reviews were converted to Cochrane Reviews, this would increase the amount of high-quality evidence in CDSR and continue to ensure that it remains the best single source of reliable evidence about the effects of health care.
• It would reduce unnecessary duplication of effort, without many resource implications for CRGs.
• IPD authors would benefit from increased accessibility to their findings and more opportunities to update reviews as new data become available.
• Although challenges exist, those respondents who have been through the conversion process have not been deterred by these challenges from converting their IPD reviews in the future.
• Clear policy and guidance, together with a better understanding by CRGs and peer reviewers of both the IPD process and the time and resource involved could make conversion of IPD reviews a much more attractive prospect in the future.

Acknowledgements

We are particularly grateful to all the members of the Methods Group who took part in the survey. We are also grateful to the Medical Research Council (UK) for supporting this research.
