The Marine Environmental Management MSc is a great course if you want to expand and further your knowledge in marine conservation. Each module provided a different skill-set and the variety of modules to choose from is great. In particular, this course enabled me to develop and improve my analytical and research skills. The summer semester was my favourite as this involved my dissertation and placement. The dissertation was a great opportunity to improve as an independent research scientist, studying a topic of my choice at an in-depth level. For my summer placement I was lucky enough to spend 2 months diving in the tropical lagoons of Rarotonga, Cook Islands. This placement was a great opportunity because it was hands-on field research and is an experience I won’t forget!

I feel that my time at York helped me to get the internship I am now in with the Zoological Society of London.
