Programme Lead	er					
Dr Detlef Plump						
Purpose and lear	ning outcom	es of the programme				
Statement of purpos	se for applicar	ts to the programme				

Computer Science and Mathematics are naturally congruent, and the BSc combined degree programme provides pathways to study each subject at a high level, with opportunities to specialise within and across both disciplines, allowing you to acquire a wide spectrum of expertise and a broad range of skills, that are valuable in their own right and in demand by key employers.

The programme will provide you with a solid foundation in the principles and practices of computer science, including coding and basic engineering, leading to advanced training in focussed areas of your choice. You will also develop your core mathematical skills, particularly in calculus and algebra, and your reasoning and analytical prowess will be sharpened as you are guided to use mathematics in deeper and more interesting ways, some of which are directly related to computation. You will experience didactic teaching delivered by computer scientists and mathematicians at the forefront of their areas of expertise, and collaborative learning through group work and team-based problem solving, equipping you to undertake in the final year a substantial independent investigation in an area of your choosing, which may be in Computer Science or Mathematics.

The variant with a year in industry provides a placement after completing two full years at university, which presents you with opportunities to apply your expertise in a commercial environment, increasing your awareness of the power and potential of applied computer science, and providing you with a keener sense of the directions you want to pursue when you return to complete the final year of the programme.

Programme Learning Outcomes

Please provide six to eight statements of what a graduate of the programme can be expected to do.

Taken together, these outcomes should capture the distinctive features of the programme. They should also be outcomes for which progressive achievement through the course of the programme can be articulated, and which will therefore be reflected in the design of the whole programme.

PLO	On successful completion of the programme, graduates will be able to:
1	Confidently and competently apply computational and mathematical thinking to problems, using skills in problem analysis, representation and abstraction, and the application of standard mathematical and computational techniques, including the theory and practice of programming and software engineering. [Computational and mathematical competence]
2	Critically analyse statements, arguments or conjectures that underpin the theory of Mathematics and Computer Science, and justify the principles chosen for such critiques. [Computational and mathematical reasoning]
3	Adapt to new and unfamiliar challenges in Computer Science and Mathematics, recognising appropriate ideas and approaches drawn from a range of technologies, languages, paradigms, models and mathematical theories. [Adaptability]
4	Conduct an independent investigation into a specialised area of Mathematics or Computer Science, by gathering material from a variety of sources, and synthesising this material into a well-organised and coherent account, or effective solution to a user-specified need. [Independence]
5	Work effectively in a team, formulating and fulfilling obligations towards achieving goals by managing workloads, setting and meeting deadlines, and optimising resources. [Team work]
6	Communicate complex ideas in Computer Science and Mathematics in a clear and organised manner, at a level appropriate for the intended recipients, and also present an effective summary of these ideas. (Deleted reference to non-expert audience.) [Communication]

7	Appreciate the wider context of Mathematics and Computer Science and their individual components, develop an awareness of issues such as information security and system reliability. [Awareness]
8	
Program	nme Learning Outcome for year in industry (where applicable)
For prog	grammes which lead to the title 'with a Year in Industry' – typically involving an additional year – please provide either a) amended versions of some (at least one,
but not	necessarily all) of the standard PLOs listed above, showing how these are changed and enhanced by the additional year in industry b) an additional PLO, if and only
if it is no	ot possible to capture a key ability developed by the year in industry by alteration of the standard PLOs.
Apply ac [Year in i	quired computational and mathematical expertise in a commercial workplace, and understand, experience and appreciate the potential of such ideas and skills in an industrial context. industry]
Program	nme Learning Outcome for year abroad programmes (where applicable)
For prog	grammes which lead to the title 'with a Year Abroad' – typically involving an additional year – please provide either a) amended versions of some (at least one, but
not nec	essarily all) of the standard PLOs listed above, showing how these are changed and enhanced by the additional year abroad or b) an additional PLO, if and only if it
is not po	ossible to capture a key ability developed by the year abroad by alteration of the standard PLOs.
Explana	tion of the choice of Programme Learning Outcomes
Please e	explain your rationale for choosing these PLOs in a statement that can be used for students (such as in a student handbook). Please include brief reference to:
i) Why th	ne PLOs are considered ambitious or stretching?
With the	possible exception of PLO4, all PLOs are partially fulfilled in each Stage of the programme. The distinctly hierarchical nature of the Stages requires students to have mastered the
knowled	ge and skills of one Stage before progressing to the next, allowing the PLOs to be addressed at deeper levels as the programme progresses. PLO4 requires a panoramic view of the
program	me, and places the responsibility for learning firmly in the hands of the student.
ii) The w	ays in which these outcomes are distinctive or particularly advantageous to the student:
Each out	come is distinctive and advantageous for students, as follows; computational and mathematical competence and problem solving (PLO1); computational and mathematical reasoning
(PLO2); a	adaptability (PLO3); independence (PLO4); team work (PLO5); communication (PLO6); awareness and professionalism (PLO7); industrial experience (PLOYI).
iii) How t	the programme learning outcomes develop students' digital literacy and will make appropriate use of technology-enhanced learning (such as lecture recordings, online resources,
simulatio	ons, online assessment, 'flipped classrooms' etc)?

Bearing in mind the title of the programme, the PLOs necessarily develop digital literacy at the highest level, including programming skills. The PLOs also necessitate use of appropriate software for writing technical documents (eg LaTeX) and delivering presentations, and in some cases require the use of specialised mathematical software (eg Maple, Matlab). More routine use of digital technology certainly includes lecture recordings (currently audio, maybe video in future), interaction with university and departmental VLEs to access bespoke online resources, elements of online assessment (for some, but not all modules).

iv) How the PLOs support and enhance the students' employability (for example, opportunities for students to apply their learning in a real world setting)? The programme's employability objectives should be informed by the University's Employability Strategy:

http://www.york.ac.uk/about/departments/support-and-admin/careers/staff/

Each PLO provides a distinct area of expertise, listed in ii) above, which when combined provide students with a skill set that is highly relevant to a wide range of careers and valued by key employers. In particular, PLO7 directly addresses responsible practice, and PLOYI provides direct experience of the commercial and industrial workplace, and in many cases provides a direct link to future employment.

vi) How will students who need additional support for academic and transferable skills be identified and supported by the Department?

Students are assessed for disability and special needs via the university's Disability Support Unit, and appropriate support provided centrally. Small group support teaching is provided to all students on a module by module basis, allowing individual students to access the academic support they require. Personal supervision is provided to each student by one of the Departments.

vii) How is teaching informed and led by research in the department/ centre/ University?

All didactic teaching is delivered by computer scientists and mathematicians who work at the forefront of their areas of expertise, and are therefore engaged in and aware of current research, cutting edge methodology, etc. Many modules in the final year of the programme are designed around the research interests of staff (for example, quantum computation, cryptography, computer vision).

Stage-level progression

Please complete the table below, to summarise students' progressive development towards the achievement of PLOs, in terms of the characteristics that you expect students to demonstrate at the end of each year. This summary may be particularly helpful to students and the programme team where there is a high proportion of option modules.

Note: it is not expected that a position statement is written for each PLO, but this can be done if preferred (please add information in the 'individual statement' boxes). For a statement that applies across all PLOs in the stage fill in the 'Global statement' box.

Stage 0 (if your programme has a Foundation year, use the toggles to the left to show the hidden rows)

Stage 1

On progression from th	e first year (Stage 1), stu	idents will be able to:	Understand and a Understand and a theorems. Programme Map											
Please note: the programme map below is in interim format pending the development of a Unive	rsity Programme Catalogue.										

Programme Map: Module Contribution to Programme Learning Outcomes

This table maps the contribution to programme learning outcomes made by each module, in terms of the advance in understanding/ expertise acquired or reinforced in the module, the work by which students achieve this advance and the assessments that test it. This enables the programme rationale to be understood:

• Reading the table vertically illustrates how the programme has been designed to deepen knowledge, concepts and skills progressively. It shows how the progressive achievement of PLOs is supported by formative work and evaluated by summative assessment. In turn this should help students to understand and articulate their development of transferable skills and to relate this to other resources, such as the Employability Tutorial and York Award;

• Reading the table horizontally explains how the experience of a student at a particular time includes a balance of activities appropriate to that stage, through the design of modules.

Stage	Module		Programme Learning Outcomes										
		PLO1 PLO2 PLO3 PLO4 PLO5 PLO6 PLO7											

			Confidently and competently apply computational and mathematical thinking to problems, using skills in problem analysis, representation and abstraction, and the application of standard mathematical and computational techniques, including the theory and practice of programming and software engineering. [Computational and mathematical competence]	Critically analyse statements, arguments or conjectures that underpin the theory of Mathematics and Computer Science, and justify the principles chosen for such critiques. [Computational and mathematical reasoning]	Adapt to new and unfamiliar challenges in Computer Science and Mathematics, recognising appropriate ideas and approaches drawn from a range of technologies, languages, paradigms, models and mathematical theories. [Adaptability]	Conduct an independent investigation into a specialised area of Mathematics or Computer Science, by gathering material from a variety of sources, and synthesising this material into a well-organised and coherent account, or effective solution to a user-specified need. [Independence]	Work effectively in a team, formulating and fulfilling obligations towards achieving goals by managing workloads, setting and meeting deadlines, and optimising resources. [Team work]	Communicate complex ideas in Computer Science and Mathematics in a clear and organised manner, at a level appropriate for the intended recipients, and also present an effective summary of these ideas. (Deleted reference to non-expert audience.) [Communication]	Appreciate the wider context of Mathematics and Computer Science and their individual components, develop an awareness of issues such as information security and system reliability. [Awareness]	
Stage 1	Calclulus	Progress towards PLO	Competently use the standard methods of differential and integral calculus	Justify the steps in the solution of calculus problems, or their application	Adapt standard calculus tools to problems slightly outside the standard format			Present clear and concise solutions to exercises	Understand how The Calculus has developed to enable the solution of a variety of mathematical problems related to geometry and the physical sciences	

		By working on (and if applicable, assessed through)	lecture material and exercises, with the support of seminars and formative feedback through marked work, and assessed by examination.	lecture material and exercises, with the support of seminars and formative feedback through marked work, and assessed by examination.	exercises, with formative feedback through marked work and seminars, and assessed by examination.			exercises, with the support of seminars and formative feedback through marked work.	lecture material, exercises and with the support of seminars.	
Stage 1	Algebra	Progress towards PLO	Competently use the standard algebra of vectors, matrices and related objects	Justify the steps and methods used in algebraic arguments	Adapt the standard algebraic tools to problems slightly outside the standard format			Present clear and concise solutions to exercises	Understand how algebraic methods have developed to allow the solution of a variety of mathematical problems related to symmetry, geometry, combinatorics and the physical sciences	
		By working on (and if applicable, assessed through)	lecture material and exercises, with the support of seminars and formative feedback through marked work, and assessed by examination.	lecture material and exercises, with the support of seminars and formative feedback through marked work, and assessed by examination.	exercises, with formative feedback through marked work and seminars, and assessed by examination.			exercises, with the support of seminars and formative feedback through marked work.	lecture material, exercises and with the support of seminars.	
Stage 1	Mathematical Skills 1: Reasoning and Communication	Progress towards PLO	Competence in working with sets, functions, logic and methods of proof	Practice different methods of mathematical reasoning	Adapt the standard concepts of set theory and logic to problems slightly outside the standard format	Find relevant resources and understand their content	Contribute towards the group report as a collaborative effort in exposition. This is part of the summative assessment.	Practice and develop written and oral communication skills, by preparing written group report and giving short oral presentation.	Understand how mathematics is used to solve a variety of interesting problems	

		By working on (and if applicable, assessed through)	lecture material and exercises, with formative feedback through marked work and the tutorials, and assessed by examination.	lecture material and exercises, with formative feedback through marked work and tutorials, and assessed by examination.	exercises, with formative feedback through marked work and tutorials, and assessed by examination.	the group project.	the group project.	exercises, with the support of tutorials and formative feedback through marked work, and the production of the group project and group presentation.	lecture material, exercises, and the topic of the group project, with support of the tutorials and as assessed by the group project/presentat ion.	
Stage 1	ICAR	Progress towards PLO	Design simple computer architectures from basic building blocks (CPU, memory, peripheral devices, systems buses) and then assess their performance for a given problem		Adapt to new instruction sets and future technologies		Work cooperatively in order to design, implement and test a program for a given problem	Explain the thought processes in solving complex computational problems	An initial consideration of the importance of security in system design	
		By working on (and if applicable, assessed through)	solving a series of exercises.		writing assembly language programs on a wide range of processor architectures.		working with a partner during practical sessions. (This is a compulsory module.)	working with a partner during practical sessions.	designing software which considers security.	
Stage 1	MFCS	Progress towards PLO		Acquire skills in abstract representation, problem analysis and formal reasoning, and a practical grasp of foundational ideas and methods	Capacity to acquire new terminologies, notations and conceptual models		Capacity to appreciate and combine different views	Explain the thinking about technical issues		

		By working on (and if applicable, assessed through)		solving a series of problems involving concepts of discrete maths and formal languages and automata.	working with unfamiliar notations and layered ideas in discrete mathematics and formal languages and automata.	working in small groups to solve problems. (This is a compulsory module.)	working in small groups to solve problems.	
Stage 1	ТРОР	Progress towards PLO	 (a) Develop skills including problem solving, abstract representation, ability to select or develop an appropriate algorithm/data structure and to develop appropriate software testing strategies; (b) Obtain the basic ability to build and maintain software systems, enabling larger software engineering projects 	Familiarity with the theoretical tools used to understand algroithms and their complexity	Gain the ability to develop algorithms and data structures independent of platform, and the ability to transfer skills learnt on one programming paradigm to another one	Appreciate the issues of how to communicate, argue and assess the proposed analysis of the problem, and the choice of design implementation		

				1	1	l		1

Stage 2	Pure Mathematics	Progress towards PLO	Understand the language of abstract mathematics, and work confidently with the ideas which form the basis of abstract algebra, number theory and geometry	Reproduce, with understanding, central arguments used in algebra, number theory and geometry, and be able to adapt these to similar situations	Recognise and be able to put into practice the principles of abstract mathematics in unfamiliar settings		Present coherent, clear and concise solutions to exercises	Appreciate, and be able to explain, how the fundamental ideas of algebra, number theory and geometry have arisen from, and enabled the solution of, some important problems in science	
		By working on (and if applicable, assessed through)	lecture material and exercises, with the support of seminars and formative feedback through marked work, and assessed by examination.	lecture material and exercises, with the support of seminars and formative feedback through marked work, and assessed by examination.	exercises and with formative feedback through marked work and the seminars, and assessed by examination.		exercises, with the support of seminars.	lecture material, exercises and with the support of seminars.	
Stage 2	Linear Algebra	Progress towards PLO	Use the standard methods of basic linear algebra and matrix theory, and their theoretical justification through abstract algebra	Prove standard results in abstract linear algebra	Apply basic linear algebra and matrix theory to a range of unfamiliar situations		Present clear and concise solutions to exercises	Appreciate the power of the abstract approach to linear algebra and the variety of uses of linear algebra	
		By working on (and if applicable, assessed through)	lecture material and exercises, with the support of seminars and formative feedback through marked work, and assessed by examination.	lecture material and exercises, with the support of seminars and formative feedback through marked work, and assessed by examination.	exercises, and with formative feedback through marked work and the seminars, and assessed by examination.		exercises, with the support of seminars.	lecture material, exercises and with the support of seminars.	

Stage 2	Vector Calculus	Progress towards PLO	Use the standard methods of multi-variable differential and integral calculus to work with functions of many variables and vector fields		Apply the standard methods to problems which require a level of interpretation to set up the application.		Present clear and concise solutions to exercises	Understand and appreciate how the methods of vector calculus arise from important problems in the study of the physical world	
		By working on (and if applicable, assessed through)	lecture material and exercises, with the support of seminars and formative feedback through marked work, and assessed by examination.		exercises and with formative feedback through marked work and the seminars, and assessed by examination.		exercises, with the support of seminars.	lecture material, exercises and with the support of seminars.	
Stage 2	сосо	Progress towards PLO	Understand the difference between solvable and unsolvable problems, and be able to analyse the computational complexity of algorithms	Appreciate the relevance of formal methods and be able to apply them to reason about software and hardware systems	Adapt to the properties of new languages and paradigms				
		By working on (and if applicable, assessed through)	studying (semi-) decidable languages, Turing- computable functions and the time and space complexity of Turing machines.	formally analysing correctness, termination and complexity properties of Turing machines.	studying computability and complexity in a basic computational model.				

Stage 2	POPL	Progress towards PLO	Ability to judge the most effective programming techniques for a particular computational requirement	Ability to make effective use of current and future programming language implementations	Adapt to changes in language fashions, and new technologies as they occur during their careers		Communicate the choice of principles and technical rationales		
		By working on (and if applicable, assessed through)	characterising different programming principles, including concurrency.	implementing a series of simple programming languages displaying the abstract principles, and solving similar classic problems in several different languages.	understanding and applying the fundamentals of different programming languages.		solving formative and summative problems in a variety of languages, and writing concise and focussed explanations of the solutions.		
Stage 2	ARIN	Progress towards PLO	Ability to apply computational thinking to problems that can be solved using core Al techniques	Acquistion of core Al techniques	Ability to apply knowledge of AI as part of a larger problem, and to transfer acquired skills to solving unseen problems			Exposure to wider applications of AI across engineering	
		By working on (and if applicable, assessed through)	practising the key principles underlying search algorithms, machine learning algorithms and approaches to and formalisms for problem and knowledge representation.	learning the key principles underlying search algorithms, machine learning algorithms and approaches to and formalisms for problem and knowledge representation.	using industrial- strength tools for specific problems in AI, and considering a range of problems that can be addressed using AI techniques.			working on a variety of problems across problem domains.	

Stage 2	SYST	Progress towards PLO	Ability to build systems that exhibit required non-functional properties inclduing data consistency, process separation and (aspects of) security	Ability to apply the principles of resource management, networks, concurrency and databases	Adapt to new systems programming approaches		Gain experience of communicating with stakeholders	Develop engineering and problem-solving skills for buidling systems that can be applied to current and future industrial problems	
		By working on (and if applicable, assessed through)	understanding how hardware supports an Operating System's provision of resource management.	understanding these principles and the characteristics of these topics.	experiencing the principles of and different approaches to systems programming (including networks and databases).		solving formative and summative problems, together with a varietry of laboratory problems, requiring writing concise and focussed explanations of the solutions.	solving realistic problems posed in laboratory sessions.	
Stage 2	IMPL	Progress towards PLO	 (a) Develop and be able to recognise situations in which a pipeline architecture can be applied, including its associated techniques, to represent sentences of formal languages; (b) Generally improve acquired software engineering skills 	Build understanding of the relationship between high and low level expression of computation	Improve adaptability to new programming languages and paradigms				

		By working on (and if applicable, assessed through)	 (a) implementing appropriate algorithms for each phase of the compiler pipeline, drawing on foundations such as formal language theory and Natural Deduction presentations of types and semantics; (b) developing all the components of a compiler. 	exploring the relationship between source code and machine-level code.	experiencing a new programming language paradigm, lazy functional programming.			
Stage 2	VIGR	Progress towards PLO	Process visual and graphical information, and develop appropriate algorithms and programs	Understand the requirements of visual information processing, and implement computational thinking into software for analysing images and for creating computer graphics	Adapt to any programming language and library used for processing visual information and in computer graphics		Communicate with technical and non- technical people about the solutions for and suitable approaches to complex computational problems of visual information processing, in a clear and organised manner	

		By working on (and if applicable, assessed through)	applying the theory of visual information processing and computer graphics into programs, and testing them in processing visual representation data, using physical sciences understanding and computing skills.	applying computational modelling of visual information, using specific algorithms for image analysis (computer vision) and for creating images (computer graphics).	learning the principles of visual infomation analysis, including the physics and geometry of scene information in visual systems.		learning and understanding how to represent and process visual information and its underlying principles.		
Stage 3	Final Year Mathematics Project	Progress towards PLO		Justify the reasoning and/or choice of methods used in the mathematics relevant to the project topic	Adapt and apply the mathematics learned during the degree to some challenging topic outside the BSc degree syllabus	Conduct an independent study into a specialised area of mathematics, by researching material from a variety of sources, and synthesise this material into a well-organised and coherent account	Communicate complex mathematical ideas clearly in writing at the final year BSc level, and also be able to present an effective summary of these ideas for non-experts	Understand and be able to explain the context and/or role of the mathematics presented in the dissertation, both in mathematics and more widely in the sciences to which the project topic is relevant	
		By working on (and if applicable, assessed through)		the project dissertation, with the support of the project supervisor and as assessed by the dissertation.	material found in the literature, with the support of the project supervisor and as assessed by the dissertation.	the project dissertation, with the support of the project supervisor and as assessed by the dissertation.	the project dissertation and the poster, with the support of the project supervisor and the lectures on writing mathematics, as assessed by the writing assignments and the dissertation.	the introduction and conclusion of the dissertation, and the writing assignment which addresses that aspect.	

Stage 3	Differential Geometry	Progress towards PLO	Understand and be able to calculate the standard geometric properties of curves and surfaces	Justify the steps made in differential geometric arguments	Decide which geometric properties can be evaluated given different representations of a curve or surface		Present clear and concise solutions to exercises	Comprehend the power and central importance of coordinate invariance in geometry	
		By working on (and if applicable, assessed through)	lecture material and exercises, with the guidance and support of seminars, and through feedback on marked work, and as assessed through examination.	lecture material and exercises, with the guidance and support of seminars, and as assessed through examination.	lecture material and exercises, with the guidance and support of seminars, and as assessed through examination.		exercises, with the support of seminars and formative feedback through marked work.	lecture material and seminar discussion.	
Stage 3	Dynamical Systems	Progress towards PLO	Analyse the qualitative features of simple dynamical systems	Justify the conclusions of a qualitative analysis of a nonlinear system	Adapt standard techniques to unfamiliar nonlinear dynamical systems		Present clear and concise solutions to exercises	Comprehend the value of qualitative analysis in the context of dynamical systems	
		By working on (and if applicable, assessed through)	lecture material and exercises, with the guidance and support of seminars, and through feedback on marked work, and as assessed through examination.	lecture material and exercises, with the guidance and support of seminars, and as assessed through examination.	exercises, with the guidance and support of seminars, and through feedback on marked work, and as assessed through examination.		exercises, with the support of seminars and formative feedback through marked work.	lecture material, exercises and seminar discussion.	

Stage 3	Number meory	Progress towards PLO	Understand and be able to use a wide range of methods from analytic number theory, Diophantine equations and Diophantine approximation	Comprehend and produce mathematical arguments to support claims concerning fundamental properties of numbers	Apply analytic/number theoretic foundations to solve specific problems (eg. counting primes, Waring's problem) and develop new areas (Diophantine approximation)		Present clear and concise solutions to exercises	Comprehend the power and central importance of Number Theory to solve deep concrete problems	
		By working on (and if applicable, assessed through)	lecture material and exercises, with the guidance and support of seminars, and through feedback on marked work, and as assessed through examination.	lecture material and exercises, with the guidance and support of seminars, and through feedback on marked work, and as assessed through examination.	lecture material and exercises, with the guidance and support of seminars, and as assessed through examination.		exercises, with the support of seminars and formative feedback through marked work.	lecture and problems class material, seminar discussion, and exercises.	
Stage 3	Algebraic Number Theory	Progress towards PLO	Understand what is meant by "Algebraic Number Theory", and be well- versed in many of the standard techniques	Justify the steps made in algebraic and number- theoretic arguments	Recognise various problems in algebraic number theory and apply appropriate techniques to solve them (e.g. factorisation of algebraic integers or ideals; identification of prime and irreducible elements in rings of integers)		Present clear and concise solutions to exercises	Understand the genesis of algebraic number theory through attempts to prove Fermat's Last Theorem, appreciate how algebraic ideas can influence number theory and vice versa, and witness that mathematics is a developing subject by exposure to open problems	

		By working on (and if applicable, assessed through)	lecture material and exercises, with the guidance and support of seminars, and through feedback on marked work, and as assessed through examination.	lecture material and exercises, with the guidance and support of seminars, and as assessed through examination.	lecture material and exercises, with the guidance and support of seminars, and as assessed through examination.		exercises, with the support of seminars and formative feedback through marked work.	lecture material, problem sheets and lecture/seminar discussion.	
Stage 3	Galois Theory	Progress towards PLO	Understand and be able use symmetry in the solution of polynomial equations, and the correspondence that reconstructs fields and their subfields inside groups of symmetry	Follow the reasoning behind the construction of the Galois group of a field extension, and the correspondence between its subgroups and intermediate fields	See how acquired algebraic foundations can be applied to solve specific problems (in particular, the algebraic solutions of equations and the construction using ruler and compass of specific objects)		Present clear and concise solutions to exercises	See how the abstract algebra learned in the first two years of the degree can be used in a non- trivial way to solve seemingly intractable but nevertheless quite concrete problems	
		By working on (and if applicable, assessed through)	lecture material and exercises, with the guidance and support of seminars, and through feedback on marked work, and as assessed through examination.	lecture material and exercises, with the guidance and support of seminars, and through feedback on marked work, and as assessed through examination.	lecture material and exercises, with the guidance and support of seminars, and as assessed through examination.		exercises, with the support of seminars and formative feedback through marked work.	lecture material, problem sheets and lecture/seminar discussion.	

Stage 3	Groups and Actions MAT00056H	Progress towards PLO	understand and be able to work with the theory of groups and their actions	decide which approach is appropriate to problems in group theory	follow logical steps in arguments and justify those steps		present clear and concise solutions to exercises	See how the abstract algebra learned in the first two years of the degree can be used in a non- trivial way to solve seemingly intractable but nevertheless	
		By working on (and if applicable, assessed through)	lecture note and exercise sheet material	lecture material and exercises, with the guidance and support of seminars, and as assessed through examination	exercises from exercise sheets and and past exam papers		exercises, with the support of seminars and formative feedback through marked work	quite concrete problems lecture material, problem sheets and lecture/seminar discussion.	
Stage 3	Cryptography	Progress towards PLO	Understand and be able to work with some of the mathematical underpinnings of modern cryptography	Follow the reasoning as to why a primality test or a factorisation algorithm works	Apply acquired mathematical knowledge to new areas; namely, certain cryptographic systems		Present clear and concise solutions to exercises	See how the mathematics seen in previous modules is used by modern cryptography to ensure privacy in a modern web- based world	
		By working on (and if applicable, assessed through)	lecture material and exercises, with the guidance and support of seminars, and through feedback on marked work, and as assessed through examination.	lecture material and exercises, with the guidance and support of seminars, and through feedback on marked work, and as assessed through examination.	lecture material and exercises, with the guidance and support of seminars, and as assessed through examination.		exercises, with the support of seminars and formative feedback through marked work.	lecture and problems class material, seminar discussion, and exercises.	

Stage 3	Topology	Progress towards PLO	Understand the notion of topological spaces, invariants and fundamental groups and be able to apply the ideas in an abstract setting.	Answer questions and solve problems about topological spaces that require reasoned, solid mathematical arguments	Determine when a given space is a topological space, be able to determine when two spaces are essentially the same and be able to determine what, if any, topological invariants the spaces possess		Present clear and concise solutions to exercises	Appreciate and understand the central role that topology plays in mathematics and the wider world	
		By working on (and if applicable, assessed through)	lecture material and exercises, with the guidance and support of seminars, and as assessed through examination.	lecture material and exercises, with the guidance and support of seminars, and as assessed through examination.	lecture material and exercises, with the guidance and support of seminars, and as assessed through examination.		exercises, with the support of seminars and formative feedback through marked work.	lecture material and exercises, with the guidance and support of seminars, and as assessed through examination.	
Stage 3	Numerical Analysis	Progress towards PLO	Ability to apply numerical approximation techniques to a range of standard mathematical problems	Justify which particular numerical method is appropriate in a given context, and in which sense the approximation error is small	Decide which of a range of approximation techniques can be used in unfamiliar application problems		Communicate mathematical arguments in Numerical Analysis in writing	Comprehend the value and power of numerical approximation techniques, and their applicability to the modern world	
		By working on (and if applicable, assessed through)	lecture materials, computer practicals, assessed computer-based coursework, as well as being assessed in the examination.	lecture materials, computer practicals, written coursework, and as assessed through examination.	lecture materials, computer practicals.		assessed written coursework.	lecture material, computer practicals, coursework.	

Stage 3	ARTS	Progress towards	Apply	Appreciate the	Adapt to new	Increase canacity	Ability to apply

			execution	of execution.	underlying			
			platforms.		principles that			
					Ada supports.			

Stage 3	CVIS	Progress towards PLO		Understand the complexities of algorithm design in an interdisciplinary context constrained by the underlying science of human vision, and apply this to real world problems	Increase capacity to address problems in an interdisciplinary way, not necessarily confined to CS		Develop critical writing skills	
		By working on (and if applicable, assessed through)		studying the principles underlying computer vision algorithms, both those based on algorithmics and those based on the underlying science (often physics, geometry or the biology of vision).	solving problems of algorithm design using models provided by a diverse set of disciplines.		undertaking a reading exercise and answering critical questions about a selected scientific paper describing a computer vision algorithm.	
Stage 3	GRAT	Progress towards PLO	Ability to write graph problems for solving problems in graph-like domains and reason about program correctness and complexity	Develop an appreciation for problem solving and formal reasoning in rule- based systems and domain- specific languages	Ability to adapt to the properties of new domain- specific languages			

		By working on (and if applicable, assessed through)	developing small rule-based programs for manipulating graph structures and analysing the properties of these programs.	studying the properties of rule-based systems in the domain of graphs, and the semantics and use of a non- deterministic programming language on graphs.	studying the properties of a rule-based and non- deterministic domain-specific language.			
Stage 3	ICOT	Progress towards PLO	Apply computational thinking to modern issues associated with data storage and transmission, such as protecting information from loss, and from other adverse effects associated with limited and incomplete forms of transmission	Understand the mathematical principles and difficulties which are behind the protection of confidential and private information	Adapt and extend acquired knowledge to other mathematical models, such as quantum information and computation, and network design		Ability to communicate with both mathematicians and computer scientists	
		By working on (and if applicable, assessed through)	analysing and applying methods and algorithms for data compression, and applying the principles of error correction and channel coding.	learning and practising the basic tools of cryptography.	studying and understanding the fundamental notions of information, coding and network theory.		learning the most basic definitions and theorems in information theory and also applying these tools to practical examples.	

Stage 3	INCA	Progress towards PLO	Ability to select the appropriate tools and paradigms to solve specific problems	Apply computational thinking to develop solutions to a broad range of complex problems	Adapt more readily to new technologies and paradigms	Communicate with technical stakeholders about complex issues	Communicate with technical stakeholders about complex issues		
		By working on (and if applicable, assessed through)	implementing neural network training algorithms, understanding their characteristics and analysing their performance.	implementing and using different neuron models and neural network architectures.	applying different types of neural networks to a range of real problems.	working in small groups to analyse problems, and by giving presentations about solutions.	working in small groups to analyse problems, and by giving presentations about solutions.		
Stage 3	MAIG	Progress towards PLO	Ability to solve practical problems by applying abstract interaction models and to perform a precise analysis of complex multi- agent situations	Ability to define optimal individual and group behaviours and the impact of interaction environment designs on these					
		By working on (and if applicable, assessed through)	working with mathematical abstractions and applying them to problem solving.	modelling and analyzing agent interactions as mathematical games.					
Stage 3	MLAP	Progress towards PLO	Students will be able to develop their own software solutions to novel data analysis problems	Students will be able to apply computational thinking to develop Bayesian learning algorithms for complex learning problems	Students will be able to adapt existing machine learning algorithms to new domains and new problems		Students gain experience in communicating their analysis and conclusions oin moderately complex datasets	Students will be able to analyse and interpret different types of data across disciplines	

		By working on (and if applicable, assessed through)	implementing a range of different machine learning algorithms.	learning the statistical and probabilistic principles underlying Bayesian machine learning.	understanding how a range of data analysis problems can be solved.			writing a coursework report on specific problem domains.	performing predictive analysis tasks on a variety of data coming from different application domains.	
Stage 3	PCOC	Progress towards PLO	Students will become able to carry out problem analysis using the mathematical foundations of computer science	Students will understand programming as part of an engineering discipline with solid mathematical foundations	Students will be able to handle a variety of modelling and analysis techniques to deal with with systems descriptions			Students will have an awareness of the issues of ambiguity and incompleteness in informal descriptions	Students will understand how to specify and develop alternative software designs and meet the users' needs for reliability	
		By working on (and if applicable, assessed through)	writing formal models using a data modelling language and a process algebra.	learning the mathematical principles of correctness.	learning to write models using mathematical notations.			writing formal descriptions of systems.	learning formal characterisations of the notion of correctness.	
Stage 3	PRBM	Progress towards PLO	Students learn how to engineer solutions to problems in which computation forms a significant part, and how to apply engineering principles to deliver working systems, on time	Students learn how to apply computational thinking to larger-scale problems, including appropriate problem representation, modelling and analysis	Students learn how to select, synthesise and apply appropriate techniques when faced with an unfamiliar problem	Students learn how to explain both existing approaches to computational problems and their own approaches to such problems	Students learn how to critically evaluate both existing approaches to computational problems and their own approaches to such problems	Students learn how to explain both existing approaches to computational problems and their own approaches to such problems	Students learn to recognise ethical issues, including academic integrity, and address them appropriately	

	By working on (and if applicable, assessed through)	undertaking an engineering project, including design, implementation and evaluation, and developing an engineering solution using an appropriate combination of software and hardware to meet project requirements.	starting from a broad statement of requirements, then formulating a more exact specification and overall method of solution.	tackling a problem in their project that goes beyond other modules, requiring independent literature search and critical review.	writing a substantial project report, including a literature review.	evaluating fellow-students' presentations.	writing a substantial project report, and giving a presentation.	explicitly considering such issues, both when conducting project work and when writing their report.	
	Progress towards PLO By working on (and if applicable, assessed through)								
	Progress towards PLO By working on (and if applicable, assessed through)								
	Progress towards PLO By working on (and if applicable, assessed through)								
	Progress towards PLO By working on (and if applicable, assessed through)
