

# A Planet and its People under Pressure

Georgina Mace

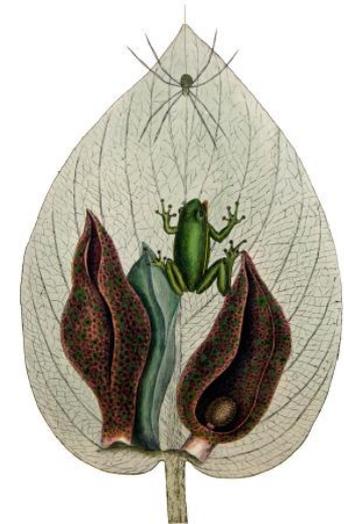

8 April 2013

York Environmental Sustainability Institute

# Outline

- Trends in population and consumption
- Impacts on biodiversity and ecosystems
- Why does it matter?
- What can be done?

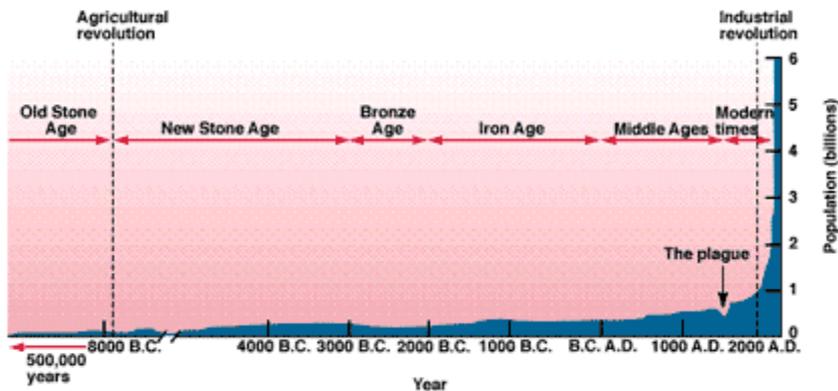

# The number of people on earth...

.. has been growing rapidly, more are expected....

....as a species we dominate the planet...

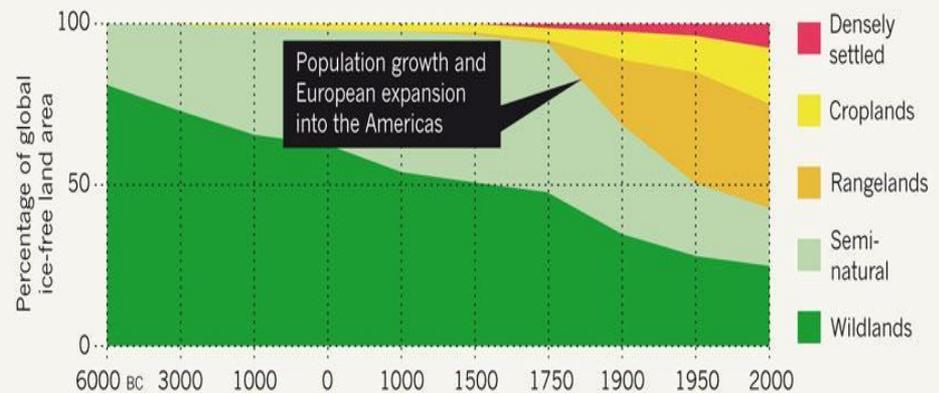

Cunningham/Saigo, Environmental Science, A Global Concern, 5th ed. © 1999 The McGraw-Hill Companies, Inc. All rights reserved.

## Human population levels through history.

## TRANSFORMATION OF THE BIOSPHERE

The effects of human intervention are now apparent on more than half of Earth's ice-free land mass.

Ellis E C Phil. Trans. R. Soc. A 2011;369:1010-1035

# Why is this a concern?

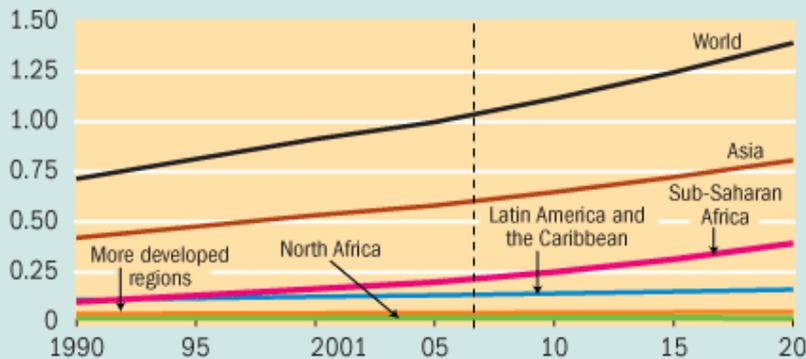

**1. People are increasingly living in dense, overcrowded conditions.....**

Chart 5

## The growth of slums

More than one in every seven human beings now lives in an urban slum.

(slum population, billions)

Source: UN-HABITAT, Global Urban Observatory database (2005).

Note: Figures for 1995 are interpolated using estimates for 1990 and 2001. Figures for 2005 are projections; Australia, New Zealand, and Japan are included in the more developed regions.

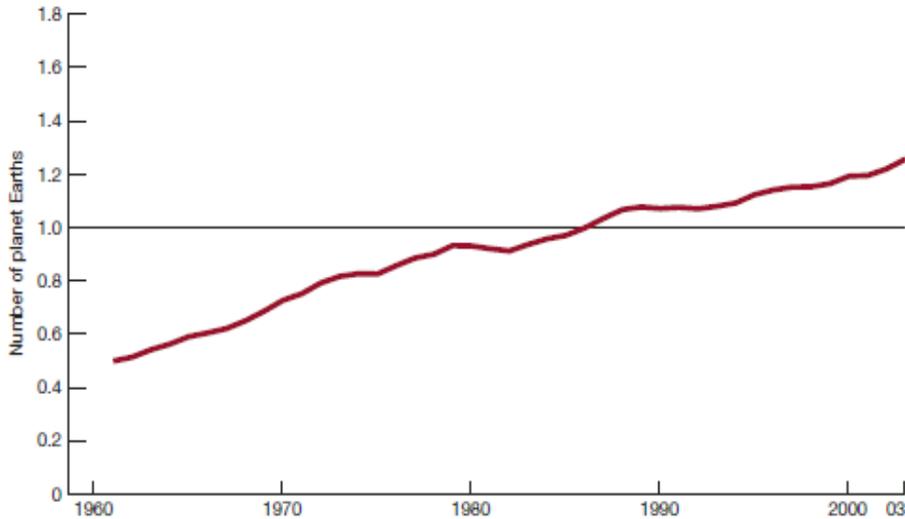

- Overcrowding:
- Mental health problems
- Poor health and diseases (e.g. tuberculosis)
- In urban areas, almost 137 million people have no access to safe drinking water, and more than 600 million do not have adequate sanitation

**Infant mortality rate MDG is not on target**

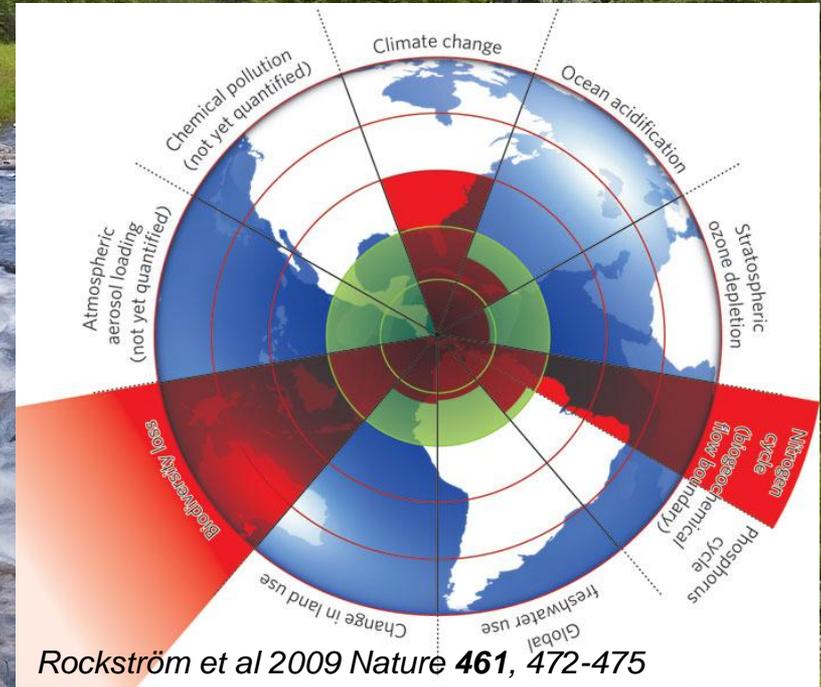

# Why is this a concern?

## 2. We are reaching environmental limits.....

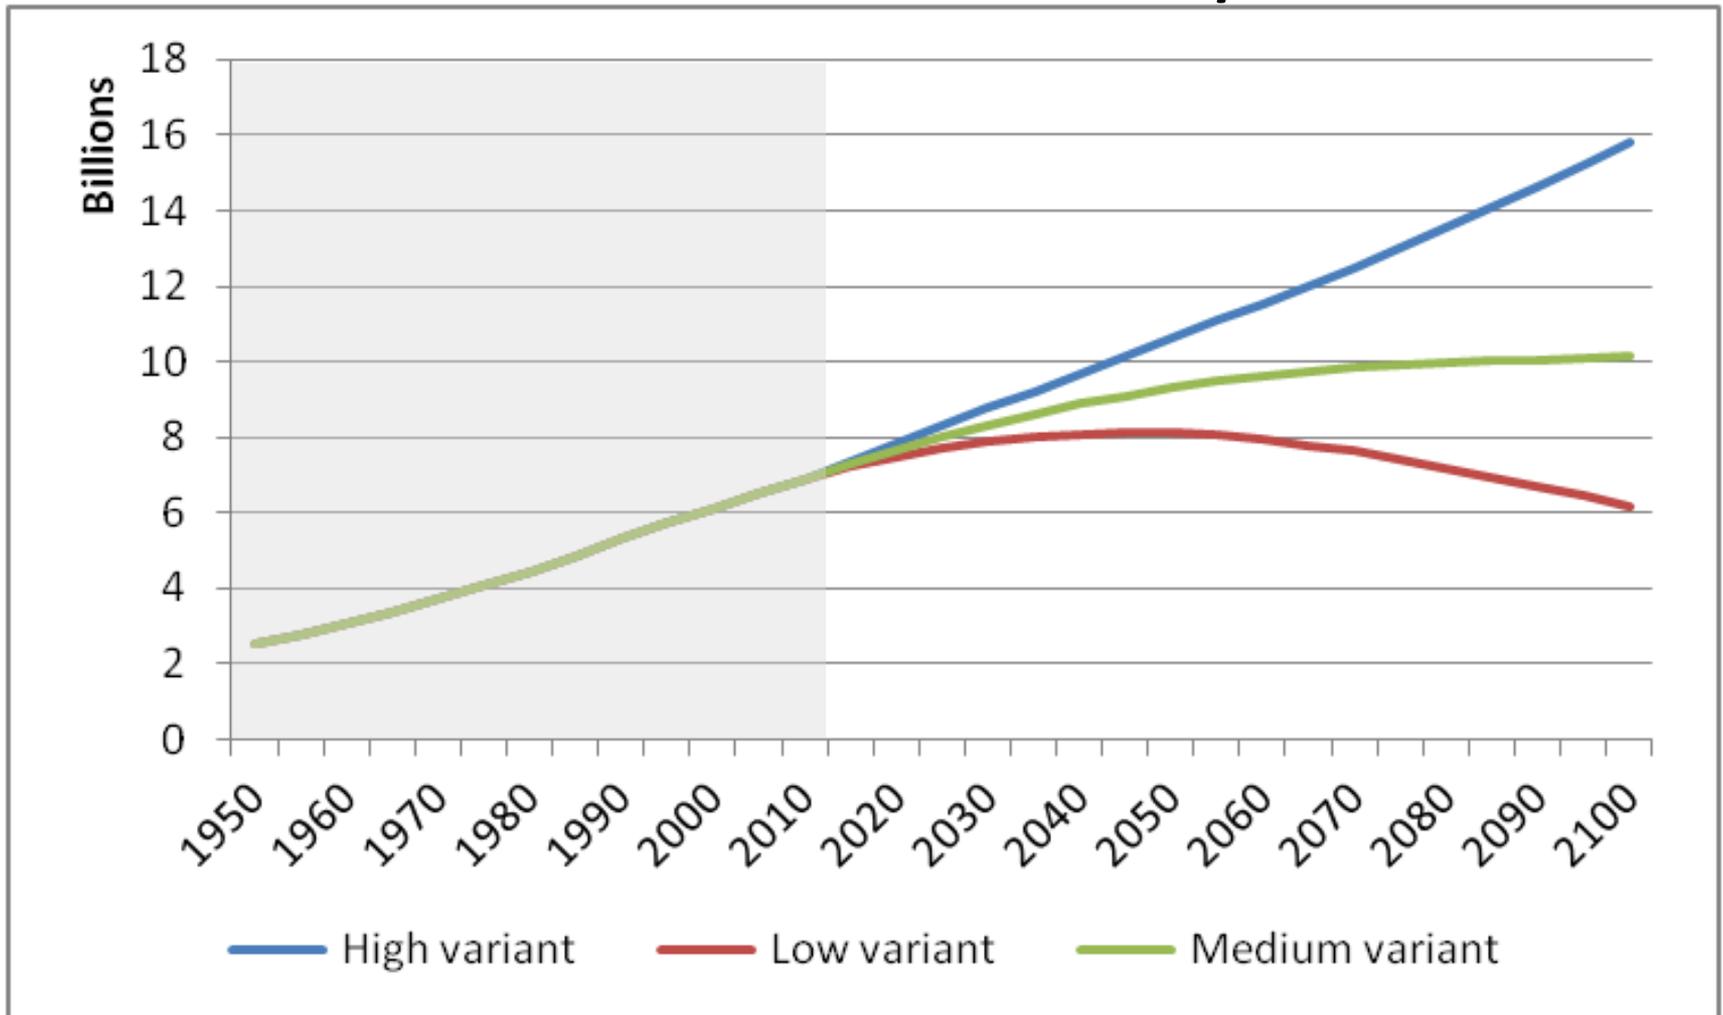

Fig. 2: HUMANITY'S ECOLOGICAL FOOTPRINT, 1961–2003

WWF Living Planet Report 2006

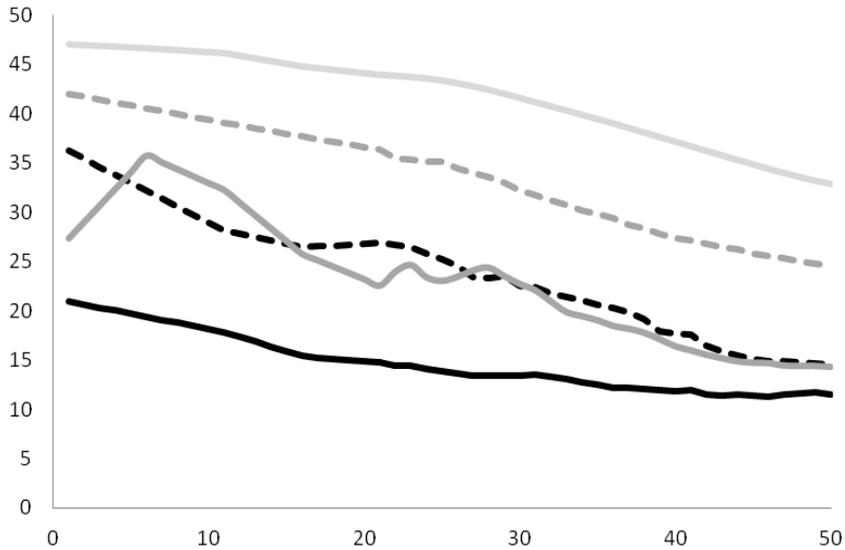

# *Human population numbers 1950-2100: observed and predicted*

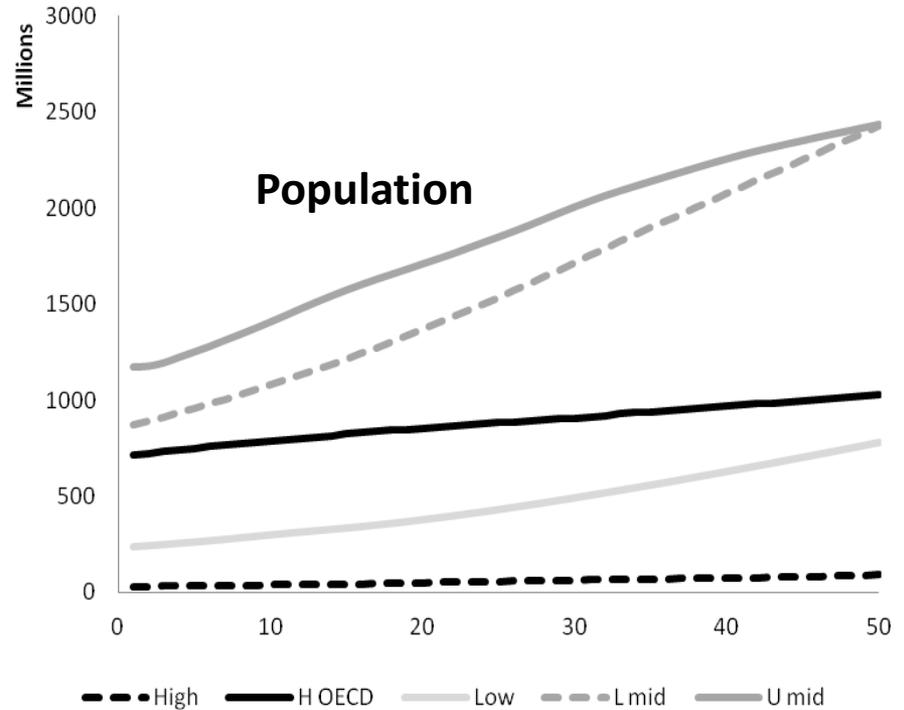

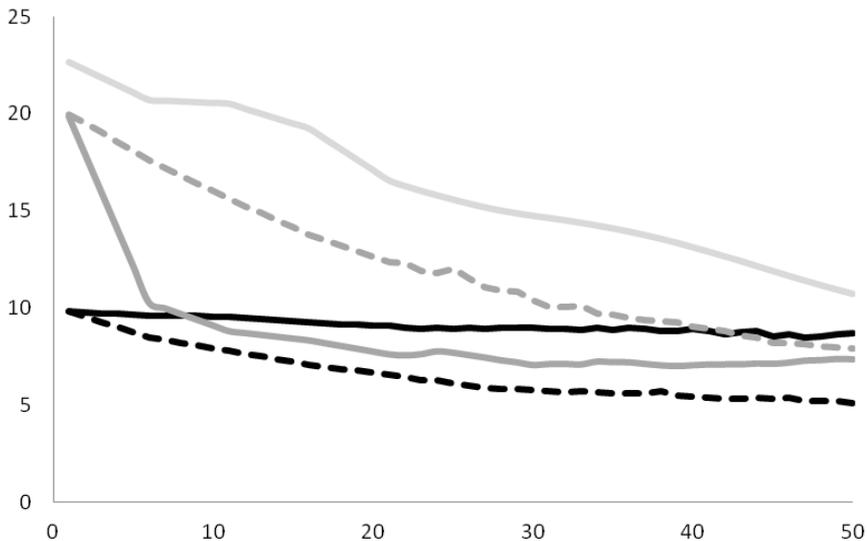

# Population change 1960-2010

## Birth rate

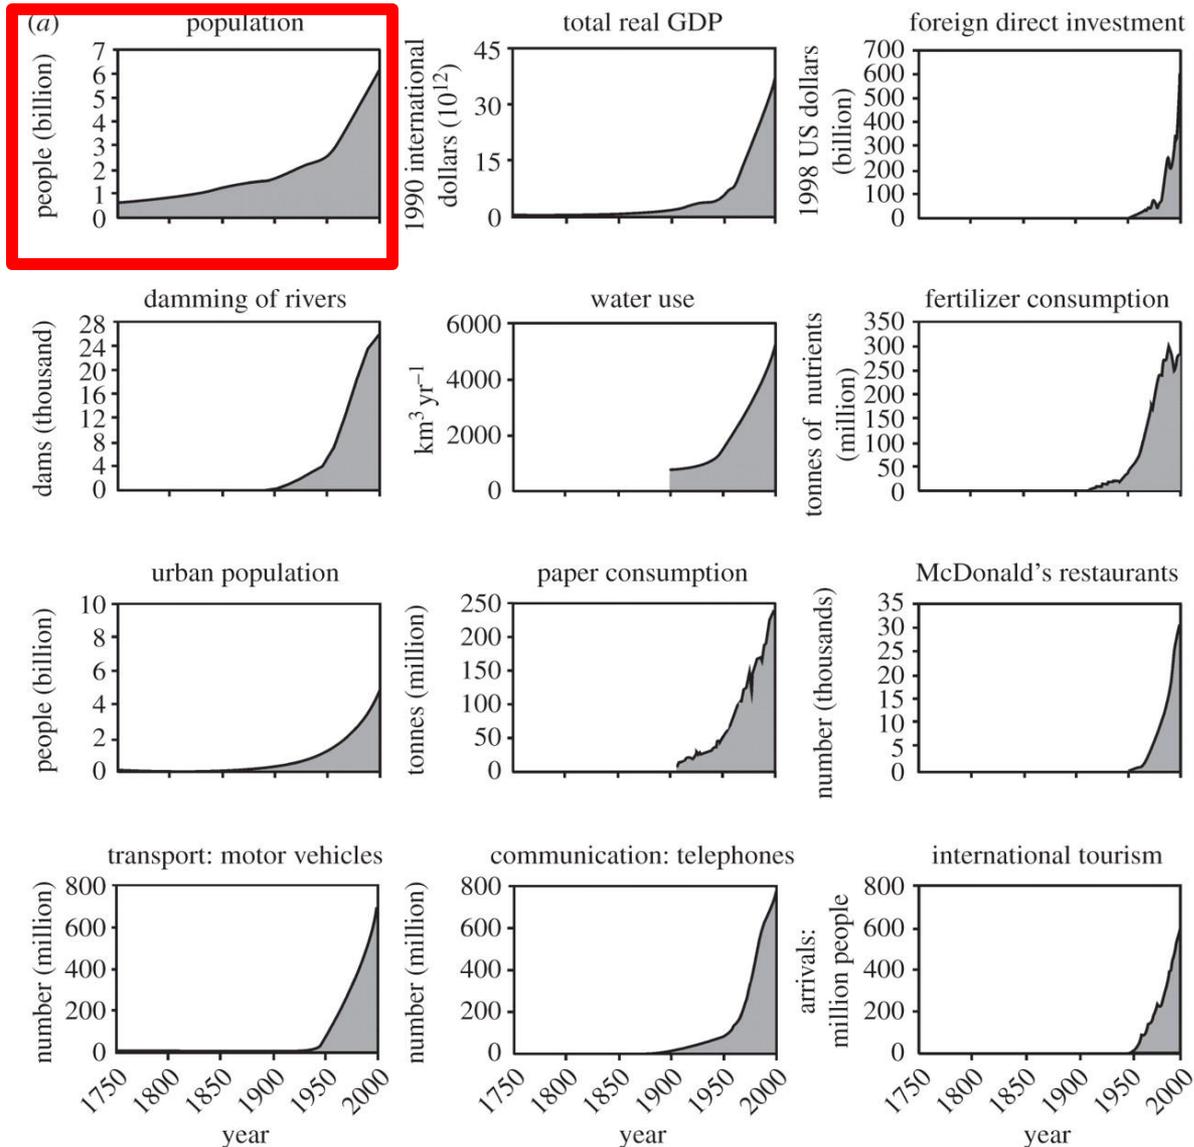

## Death rate

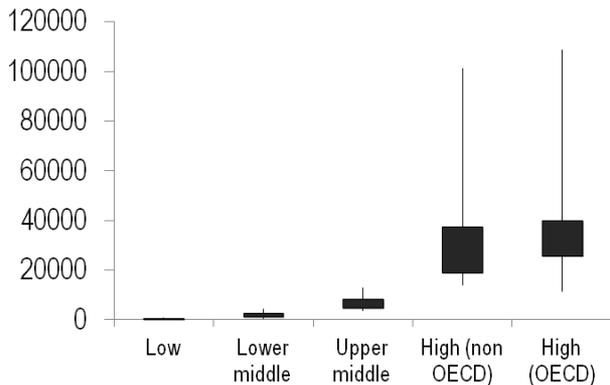

*Gross birth and death rates per 1000 population from United Nations Population Division databank*

## An unequal world

Consumption and population growth rates vary greatly across countries according to income groups

TFR 2005-2010

# Consumption and population: Annual rates of change 1970-2005

# *Pressures on the Earth must increase...*

- People already dominate the Earth and manage it for immediate needs, especially food, energy and water.
- Population numbers are still increasing.
- Consumption is growing faster than population numbers, especially in developing countries where poor living standards must improve.
- Land use change continues and climate change impacts are yet to come.

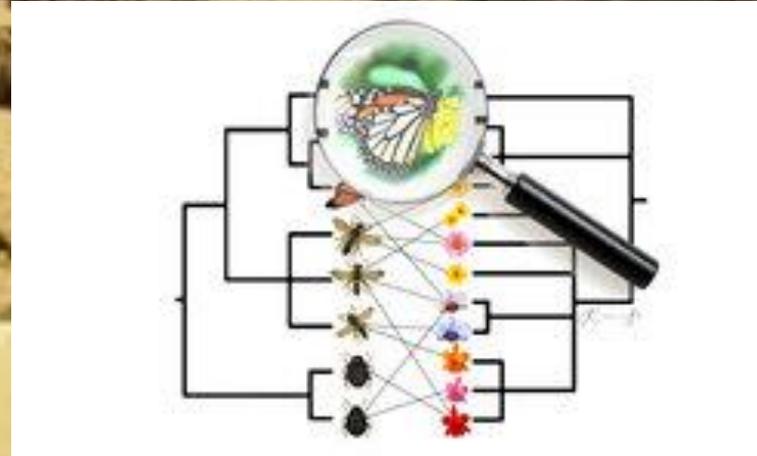

*We are going to need more environmental resources, for more people, distributed more equitably, in a changing environment.*

# **IMPACTS ON BIODIVERSITY AND ECOSYSTEMS**

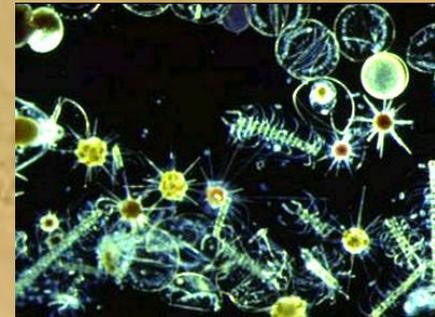

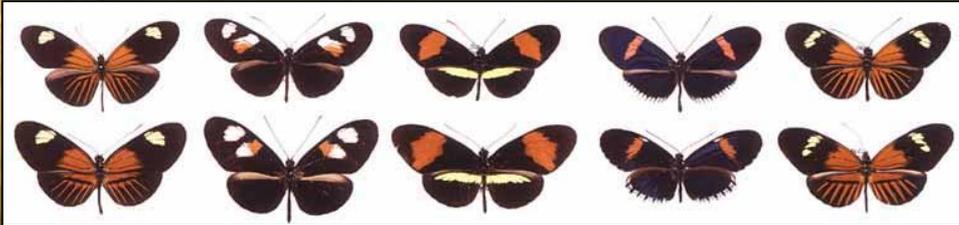

# What is biodiversity?

- **The variety of life**

- at all levels...
- .... genes, populations, species and ecosystems...
- .... land, water and air.
- .... and the interactions between living things

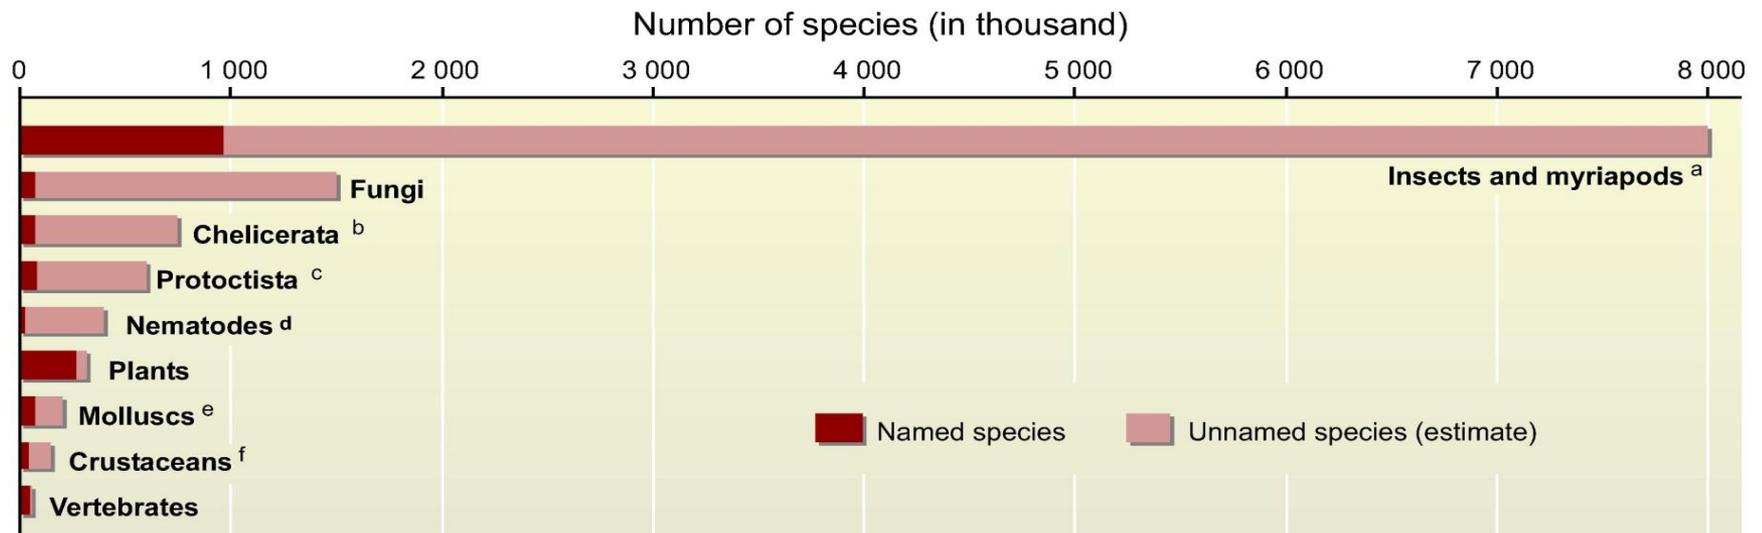

*From the definition in the Convention on Biological Diversity*

# How many species are there?

*Our knowledge of the world's species is far from complete. We don't even know how many there are and we've described less than one tenth*

<sup>a</sup> Myriapods: centipedes and millipedes

<sup>b</sup> Arachnids

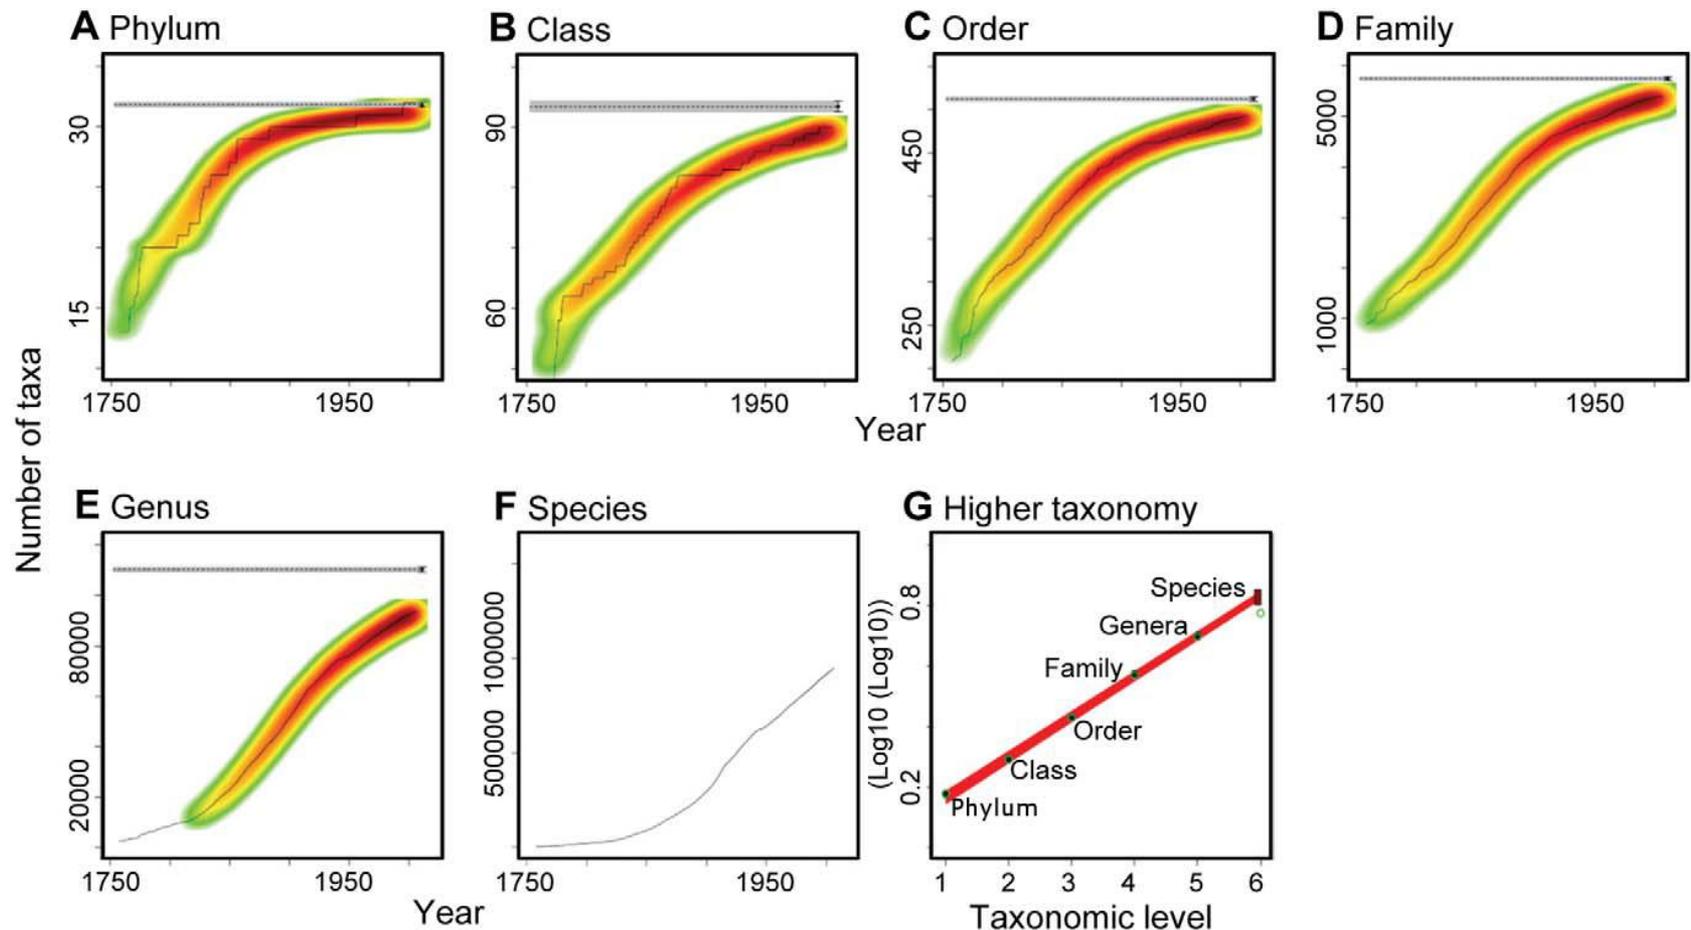

<sup>c</sup> Algae, slime mold, amoeboids, and other single-celled organisms (excluding bacteria)

<sup>d</sup> Roundworms

<sup>e</sup> Snails, clams, squids, octopuses and kin

<sup>f</sup> Barnacles, copepods, crabs, lobsters, shrimps, krill and kin

## Estimates based on consistent taxonomic patterns

Accumulation curves for taxonomic levels from Phyla to species

Analysing this pattern for all kingdoms of life on Earth predicts **8.7 million** (~1.2 million SE) species globally, of which 2.2 million (~0.18 million SE) are marine.

**86%** of the species on Earth, and 91% in the ocean, still await description.

**Table 2.** Currently catalogued and predicted total number of species on Earth and in the ocean.

Species	Earth			Ocean		
	Catalogued	Predicted	± SE	Catalogued	Predicted	± SE
<b>Eukaryotes</b>						
Animalia	953,434	7,770,000	958,000	171,082	2,150,000	145,000

# Biodiversity loss is continuing, with damaging consequences

- Biodiversity loss is continuing, often at increasing rates.
- It matters for many reasons: intrinsic and instrumental.
- Biodiversity plays a critical, if poorly understood, role in ecosystem services and functions.

Biodiversity may be more important in future than now, because of increasing pressures, multiple demands on ecosystems and a changing environment.

**WHAT CAN BE DONE?**

*Economic & Sociological*      *Population & Demography*      *Technology & Innovation*

*Climate change*      *Land & sea use change*      *Pollution & additives*      *Globalisation*

Understanding nature's value to society

## News

### Economic Analysis for Ecosystem Service Assessments, Oct 2010

The first output of the UK NEA has recently been published online in the journal *Environmental and Resource Economics*. The paper, authored by a small team of economists and natural scientists working on the UK NEA, seeks to contribute to the expanding literature on ecosystem service assessment by considering its integration with economic analyses of such services...[click here to view the full paper.](#)

### Draft key messages from the UK NEA Co-Chairs, Oct 2010

### How might UK ecosystems and

## What is the UK National Ecosystem Assessment?

The UK National Ecosystem Assessment (UK NEA) is the first analysis of the UK's natural environment in terms of the benefits it provides to society and continuing economic prosperity. Part of the Living With Environmental Change (LWEC) initiative, the UK NEA - which commenced in mid-2009 - will be reporting in early 2011. It is an inclusive process involving many government, academic, NGO and private sector institutions.

## Meetings

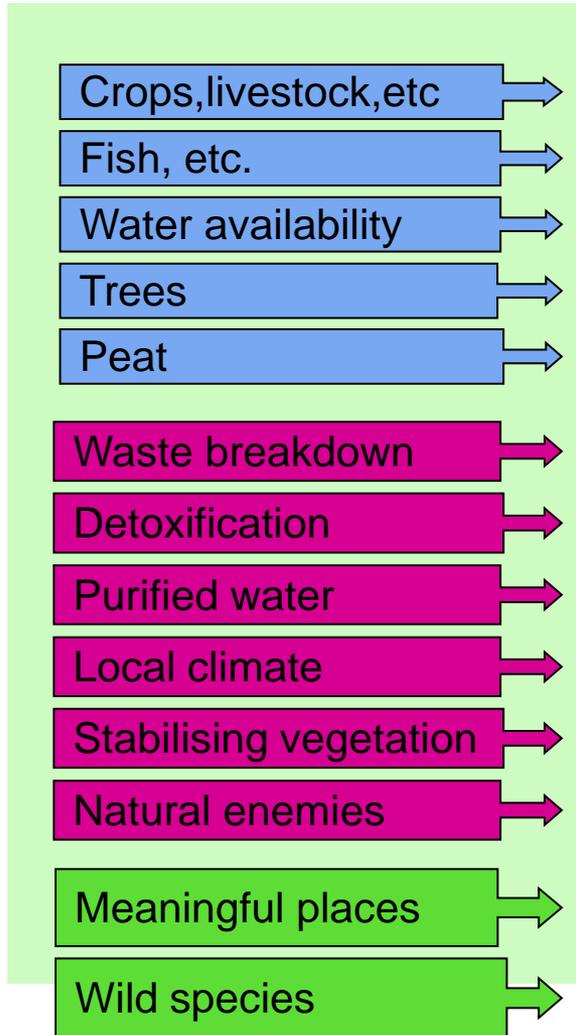

There are no further meetings planned.

Adaptation

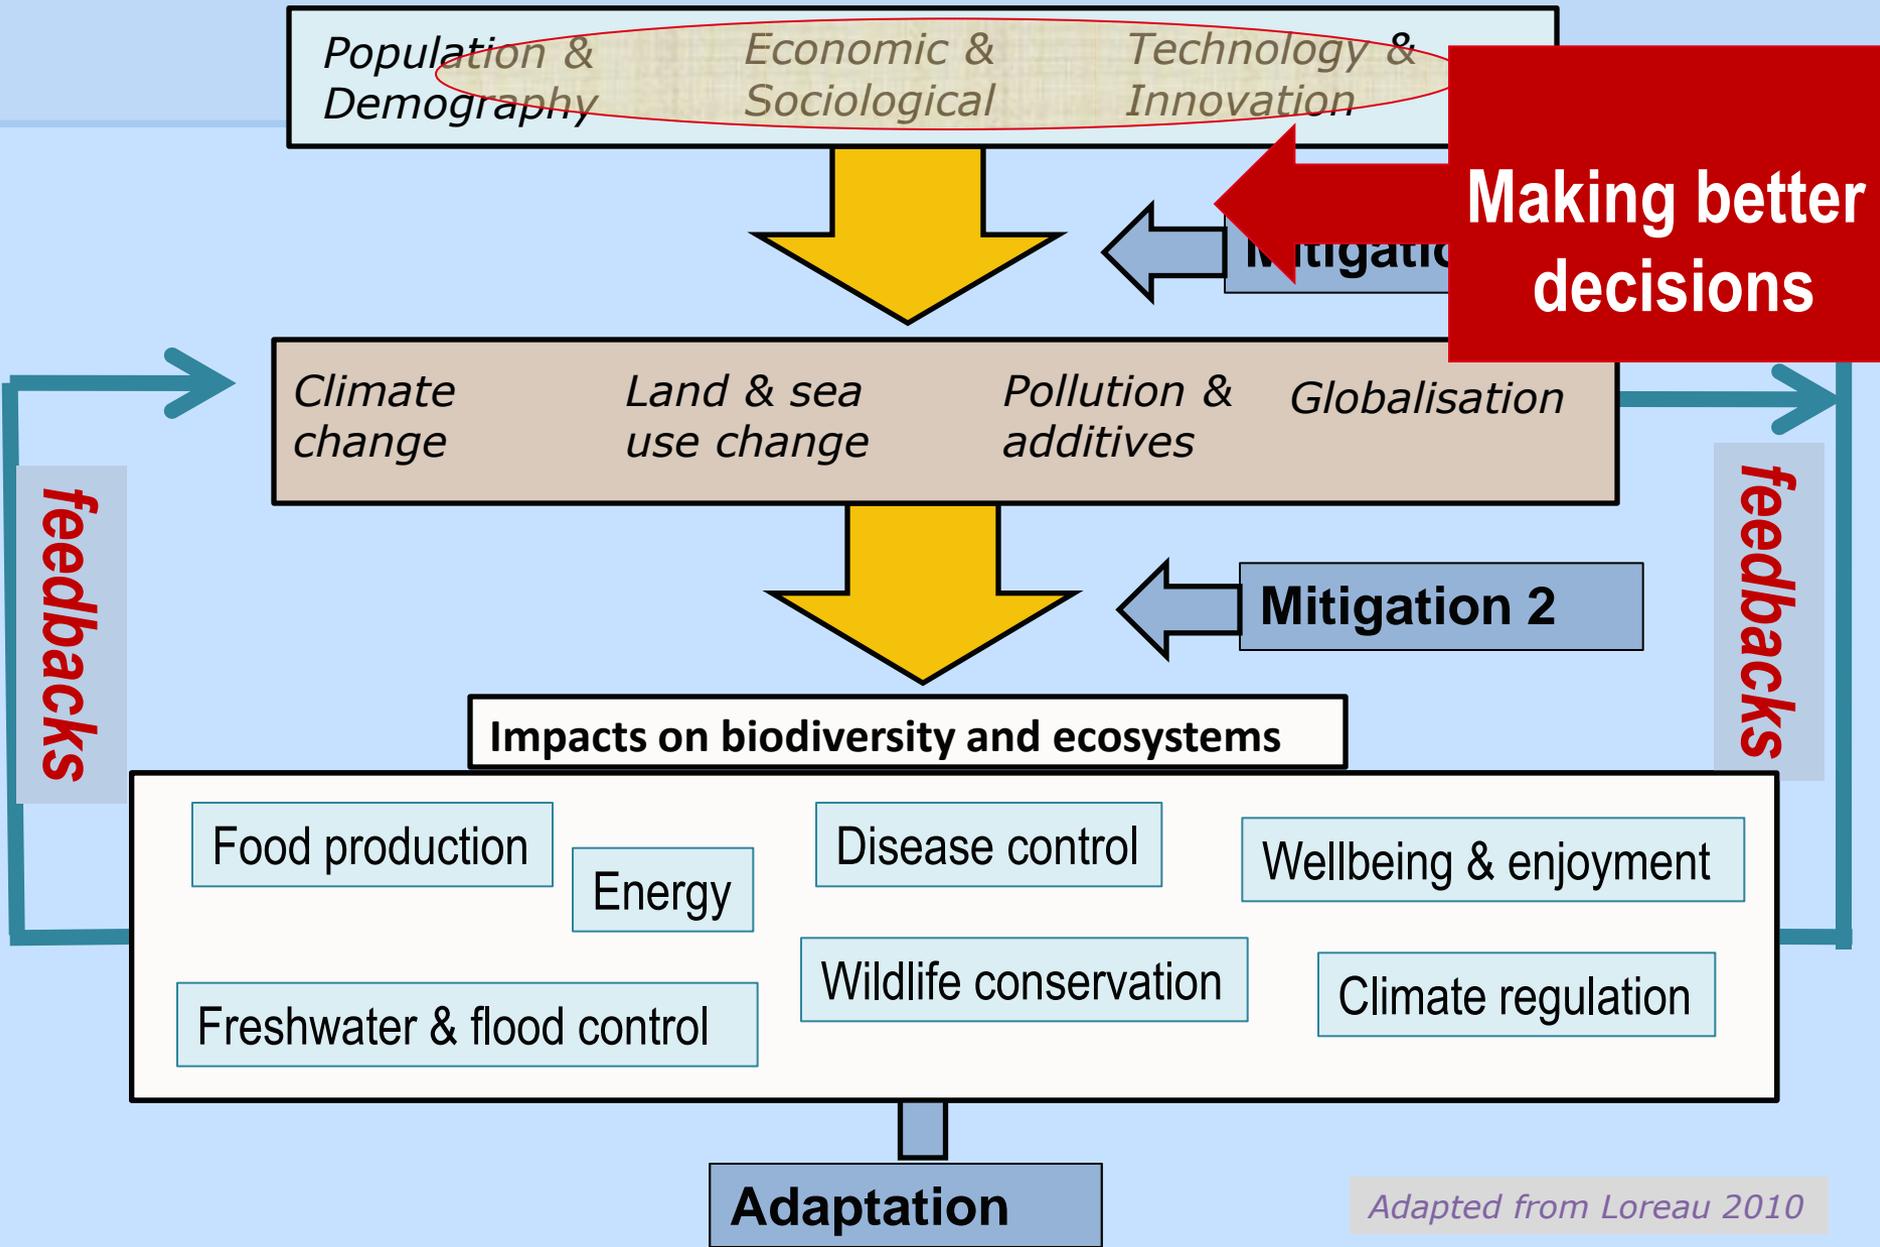

Adapted from Loreau 2010

# Reduce population growth or reduce consumption?

- In a developing country (India) and a developed country (USA)..
- using real population demography..
- assuming each person has a consumption of 1 unit per year..
- What is the effect of **reducing fertility by 1% per year for 50 years** compared to **reducing consumption by 1% per year for 50 years**?

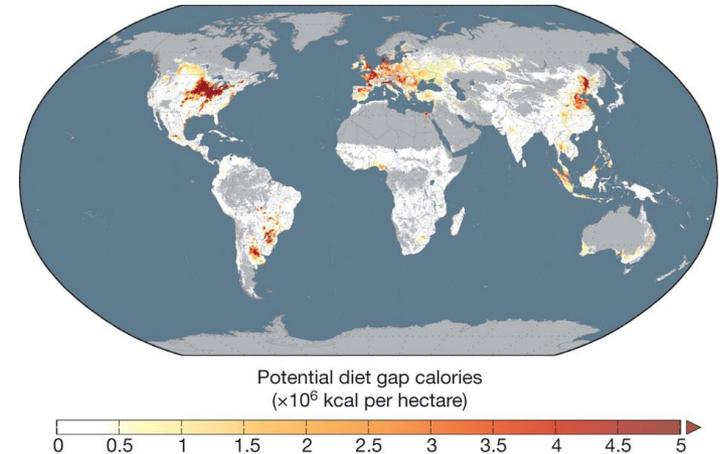

# Solutions for a cultivated planet

1. Stop expanding agricultural land
2. Increase agricultural efficiency
3. Close the diet gap, reducing waste and choosing the right crops
4. Close yield gaps on underperforming landscapes

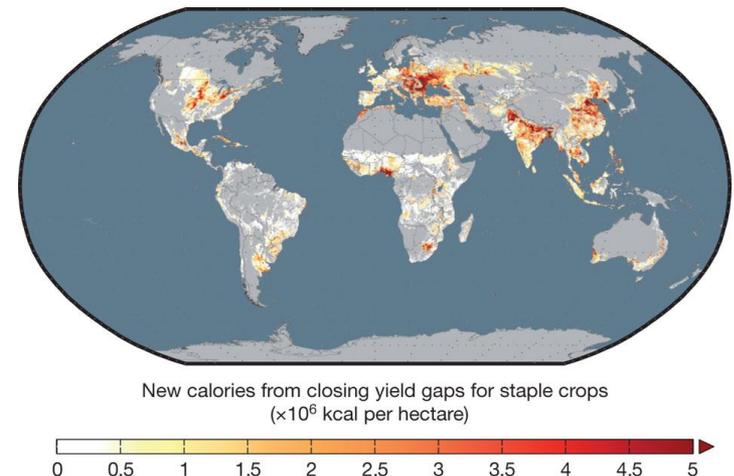

Deployed simultaneously these strategies can increase food availability by 100-180%.

At the same time - reducing greenhouse gas emissions, biodiversity loss, pollution and water use.

*Closing the diet gap.*

*Closing global yield gaps.*

# What are the obstacles?

There are many opportunities but most are stalled:

- Gaps in knowledge and information.  
Uncertainty – when do we know enough to act?
- Market failures in current policy mechanisms.
- Environmental governance at all scales - local, regional and global.
